GAVS Hackathon · Theme: MSME Finance and Compliance · Idea submission

EgoTrack

An AI finance-readiness agent that turns a micro business's scattered records into a file it can take to formal finance.

Victor Oluebubechukwu Nwokolo, founder and builder

egotrack.tech · app.egotrack.tech

Records live everywhere. Finance needs one clear file.

Records are scattered

Notebooks, receipts, phone notes and memory. Nothing adds up to one picture.

Performance is hard to show

A micro business cannot easily show cash flow, credit given or repayments to anyone else.

Requirements are hard to find

What a credit option or scheme asks for sits in many places, and the owner does not know what is missing.

7.88 crore

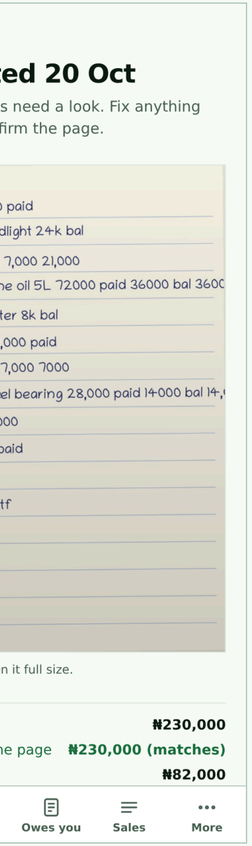

micro enterprises registered on Udyam, as reported for May 2026 (Ministry of MSME dashboard, via press). To be checked against the source.

94.6%

of 432 vendors in 101 Lagos markets keep records in a book (International Growth Centre, 2019). Lagos, not India.

30

merchant interviews in Lagos, plus 22 real notebook pages. No India interviews yet.

What a merchant's record looks like today

From scattered records to a finance-ready file

Voice, text, a photo of a record, or manual entry.

Sales, expenses, customer credit and repayments. Unclear items are asked about, never assumed.

A plain-language summary and a list of missing information.

Compare the profile with published requirements of credit options and schemes.

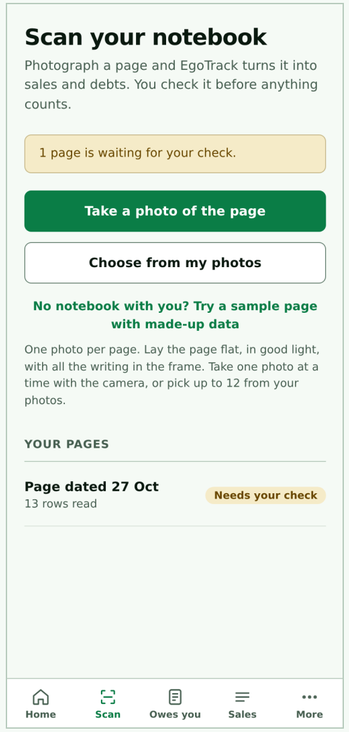

Action plan, document checklist and draft application details. The merchant approves.

Solid block: built today in the working app. Outlined: partly built. Dashed: to build in this challenge. With the merchant's consent only.

One rule runs through all five steps: the agent prepares and explains, and the owner decides. It does not lend, rate creditworthiness, promise approval or submit anything without approval.

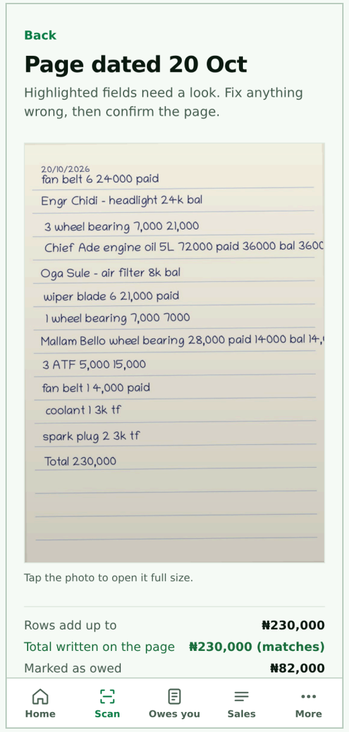

Built today: records the merchant can trust

Capture

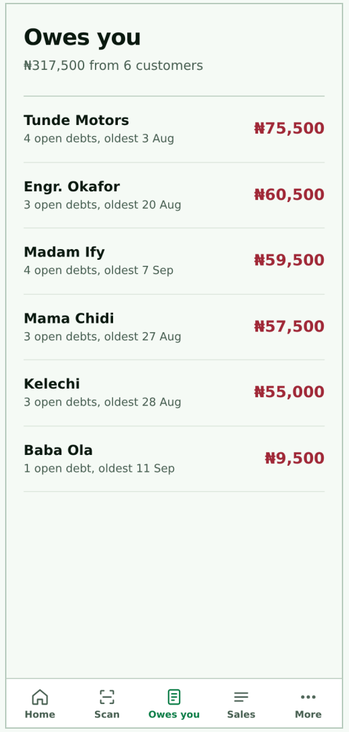

A photo of a notebook page, or manual entry.

Confirm

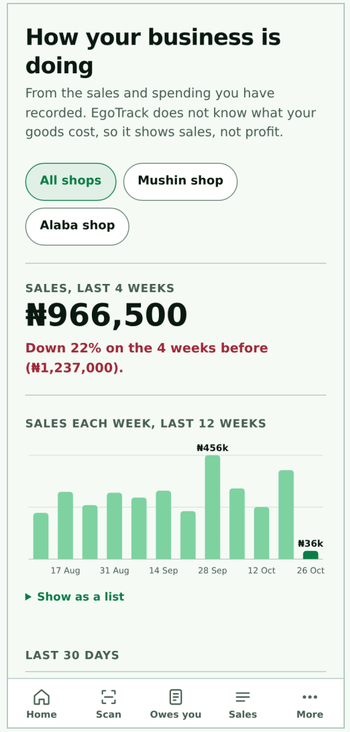

Code checks every sum. The owner confirms.

Credit

Customer credit, part payments and reminders.

Summarise

Weekly sales, change and credit share.

Live demo with a made-up shop, in naira, from the Nigerian build. No paying customers yet. India is what this challenge would adapt and test.

The agent prepares. The merchant decides.

How every action flows:

Agent reads records, only with consent → Agent drafts a summary, a gap list or a checklist → Merchant reviews and corrects → Merchant approves before anything leaves

What the agent does

Explains the business in plain words. Lists what information is missing. Shows what a credit option or scheme asks for, with the official source and date. Organises documents and drafts application details.

What it will not do

Lend, rate creditworthiness, promise or imply approval, submit anything or share personal data without explicit approval, or guess when a record is unclear.

How we keep it honest

Every scheme requirement carries its source link and the date it was read. Simulated integrations are labelled. Anything out of date is flagged for review.

Built for entry-level Android phones

Need	Today	Planned for this challenge
Voice entry	Not built	Speak a sale or an expense. The app turns it into a record and asks the owner to confirm
Local languages	English only. Pidgin, Yoruba and Igbo labels planned for Nigeria	One Indian language, chosen with the users we can reach
Low bandwidth	A web app that installs on a phone. Sales entered offline wait on the phone	Tested on a low-end Android on a weak network
Simple workflows	Usual items on one tap, total works itself out	A short flow from entry to a finance-ready summary
Scheme requirements	Not built	A small curated set from official published sources, each with link and date

Hindi or another language is not promised. We will choose with real users and mentors.

What we would build in the prototype round

Step 1
Pick the problem statement. Map the owner's journey from record to application.

Step 2
Voice and text entry become structured records. The owner confirms anything unclear.

Step 3
The agent writes a plain summary and lists missing information.

Step 4
Checklist for two or three published credit or support options, each with its source.

Step 5
Action plan and draft details. Demo with real micro business owners.

What we will show

A working flow from a spoken or photographed record to a finance-ready summary and checklist, with the merchant approving each step.

What we will not claim

No loan decisions, no approval odds, no live bank or government submission. Any integration we cannot access is simulated and labelled.

Adapting to India, without pretending we know it

What carries over

Records are scattered everywhere. The confirm-before-it-counts step, customer credit tracking and plain summaries do not depend on the country.

What changes

Currency, languages, how payments are made, which schemes and documents matter, and the rules on data and credit. We will learn these from owners and official sources.

What we do not know

We have no India users and no India interviews. The first step is to talk to micro business owners and a lender or adviser before we trust our assumptions.

Where the product was built and tested with traders.

Owners and an adviser who knows the lending side.

One language, a few published options, a small test group.

Risks, and how each is handled

Risk	How we handle it
A scheme or requirement is out of date or wrong	Official source and read date shown on every item. Stale items flagged. The owner is told to confirm with the lender or office
Wrongly read or heard records	The model only copies. Code recomputes every total. The owner confirms before anything counts. Accuracy measured on real records before we claim a number
False hope about approval	The agent never rates the business or predicts approval. The text says plainly it is a preparation tool, not a lender
Personal data	Records belong to the owner. Nothing is shared without explicit consent. India's data rules will be checked before any pilot
We are new to India	Start with owner interviews and a mentor. Keep the first scope small

The team

- Victor Oluebubechukwu Nwokolo, founder, Lagos. Software engineering student. Built the working product, interviewed Lagos traders, and designed this idea.
- Alghazali Shuaib, technical co-founder, joining. Backend and mobile. Trial period begins after mid-November 2026.
- Finalist at Ecobank InnovateX 2026, for the underlying product.

What we need

- A mentor who knows micro and small business lending in India.
- Introductions to micro business owners willing to test.
- Feedback on which published options to cover first.
- No company registered yet. Registration is planned.

Try it.

app.egotrack.tech

Scan the code to open the demo shop. The finance-readiness agent is what we would build next.

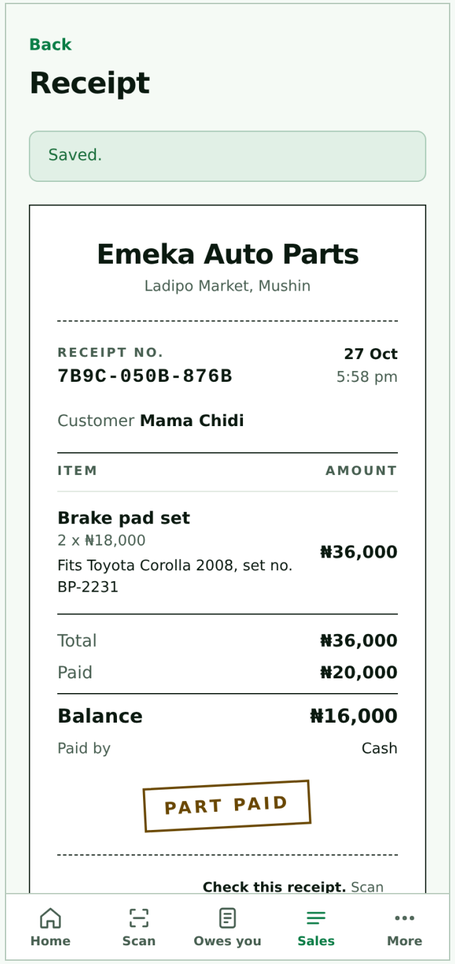

A made-up shop with made-up customers. Nothing real is shown.

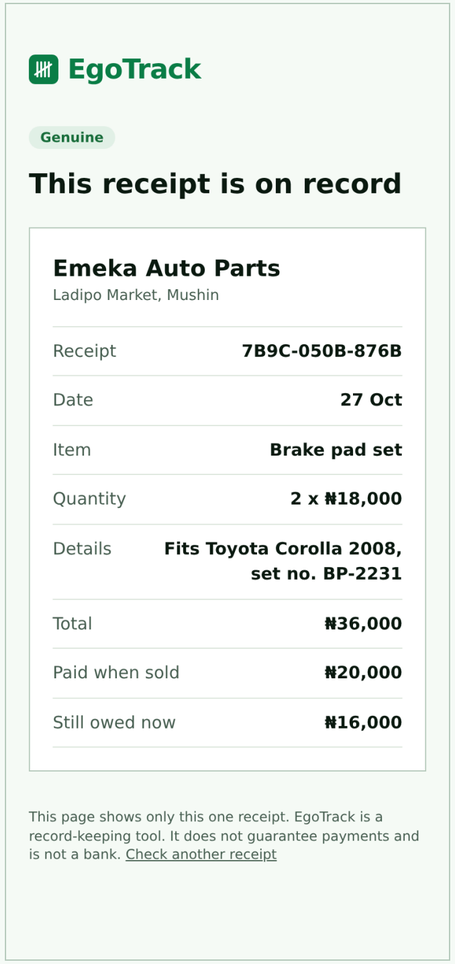

Victor Oluebubechukwu Nwokolo · founder · egotrack.tech

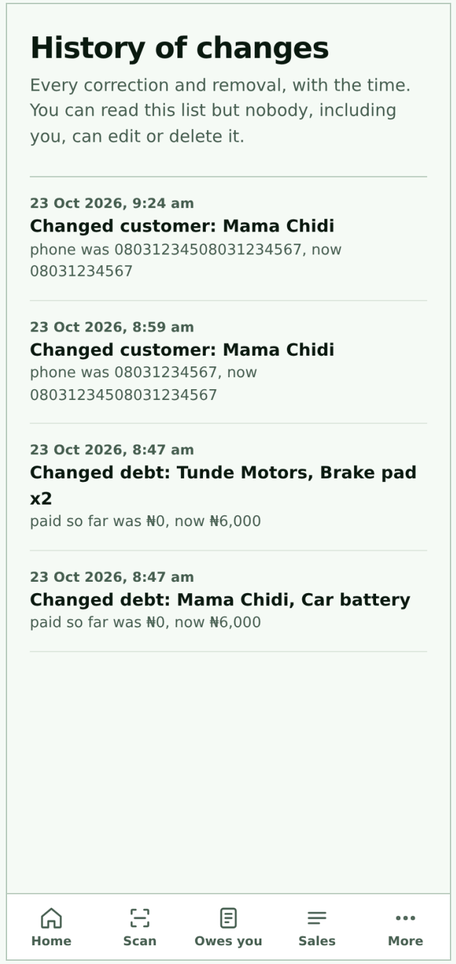

Appendix: a receipt anyone can check

- A 12-character code and a QR on every sale.
- Anyone who scans it sees the shop, item, quantity, serial number and amount, and whether it was changed or removed.
- No customer name or phone is shown, and nothing else about the shop.
- Issued only with the customer's name and number, so a returned item can be matched.

Made-up sample shop. Each correction keeps the old value in a history the owner can read but not edit or erase. Tamper-evident, not tamper-proof.

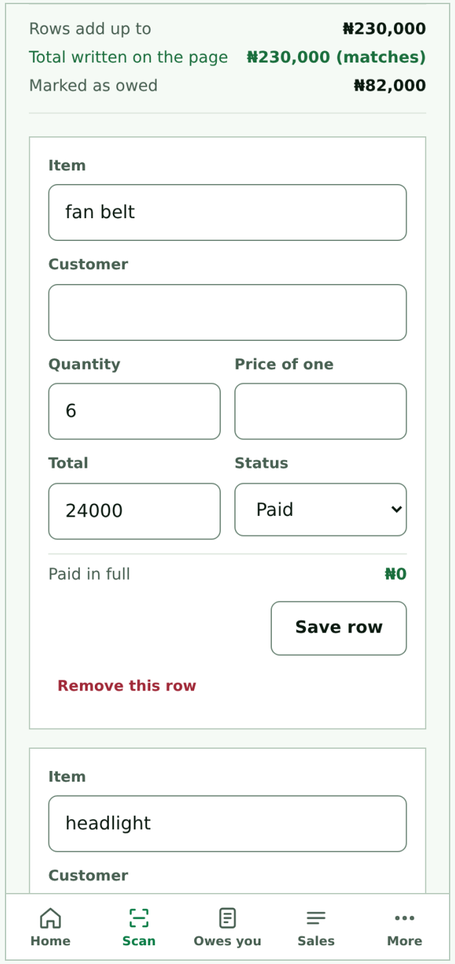

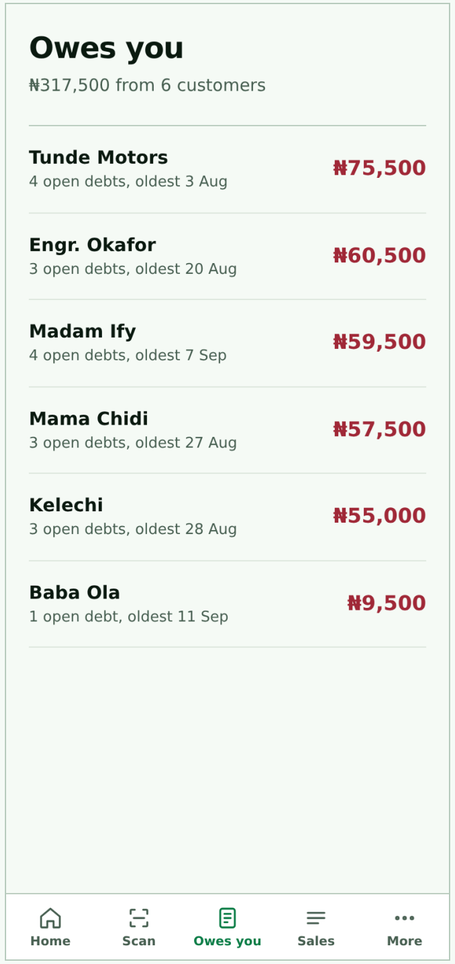

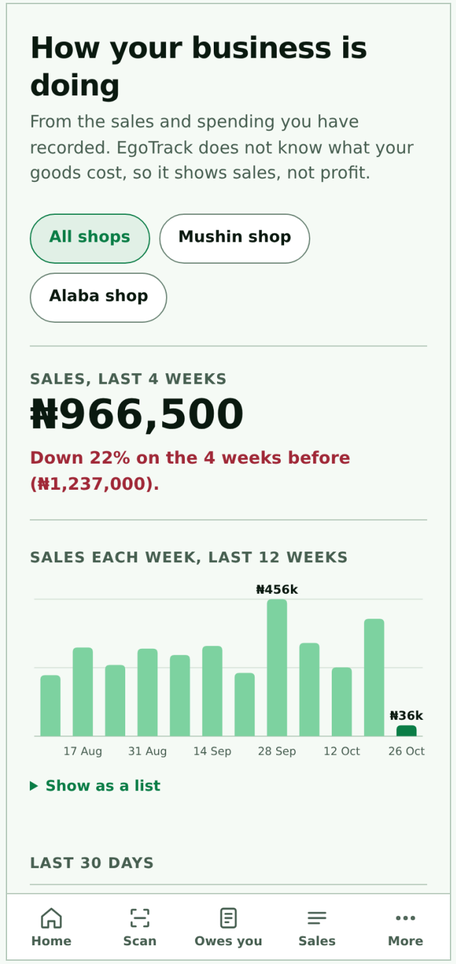

Appendix: the notebook, debts and growth

- Photograph a page. The model only copies what it sees, code checks every sum, and the trader confirms each row.
- Who owes you, with part payments and a WhatsApp reminder.
- Weekly sales, change on the last four weeks, best sellers, credit share, by branch.

Made-up sample shop. EgoTrack does not know what goods cost, so it shows sales, not profit.

Appendix: security and privacy, and the limits

Built and tested

Every record is locked to its owner in the database. Private photos. A strict script policy. A PIN lock and an optional second step at sign-in. Consent before use, and delete-my-data. Text limited to letters, numbers and simple marks.

Honest limits

A web app on a phone is not a vault. The unsent-sales queue on a phone is not encrypted yet. These are our own tests, not an independent audit. The privacy notice and terms are drafts for a lawyer.

Next

An independent security test, a lawyer's review, an encrypted offline queue, recovery codes for the second step.

265

automated tests

431

attack-style checks against the live app, none failed
